

The Chinese University of Hong Kong
Orthopaedic Learning Centre
Orthopaedic Trauma Fellowship

Report

Name: Dr. Ryosuke Kagawa Training Period: October 15 – November 9, 2007

Please list out 3 advantage & disadvantage of this fellowship program:

Advantage 1:

I was able to experience the case that I cannot experience in Japan.

Advantage 2:

I learned how to get communication with the staff in different culture and language.

Advantage 3:

I was able to know what kind of training the doctor who was about the same as oneself took in what kind of environment.

Disadvantage 1:

Because I had a hard time without words going, I was not able to readily say one's opinion.

Disadvantage 2:

I did not understand Clinic at all what I spoke without understanding words.

Disadvantage 3:

It having been possible for nothing because I was reserved with the doctor of the generation same as oneself and handed over manual skills by the operation.

Please feel free to write down your comments for this program:

It was put the one body in the environment that was totally different from Japan and it was

touched the case without I experienced without grazing it in Japan and was really good. In addition

I could know the way of measures and a different manual skill, and even a similar case was

stimulated very much. Understand that the doctor of the generation same as myself does any kind

of training in any kind of environment; for comparison with myself and close application of the

spirit of self-advancement was connected to improving it.

Please give us a brief report for this trauma fellowship program:

I repeat the same thing, but first of all I am glad at all and think that the experience that I cannot experience was possible to be it in Japan.

At first in different environment, and there was the uneasiness, but I have fellow workers are kind at all and teach it in various ways carefully, and it does not need to say that it was had an experience valuable at all. As for having won through up to the first impression in what I experienced this time, even Japan performs DHS and the γ -nail in a wound (a bone fracture) in the same way, but it is to have performed it while using the navigation system. Operation time became a little long, but I did the approach of the practiced hand precisely again easily and enabled a high operation of the precision.

At my hospital, I used the navigation system only at the time of TKR and this was surprised very much and felt it interestingly.

In addition, there were very many severe cases such as burn, and I could study very much.

Various experiences are possible and, through one month, are proud delightfully. I thank you towards a large number of staff including the professor very much.

I make use of experience here and want to work hard by life in Japan.

Thank you very much.

Ryosuke Kagawa.
